Self-Exercise: Editors. Files. Streams

These tasks can be executed either in an installation with or without desktop environment

Make sure you are working with a regular user (for example, the **lsauser** created during the initial installation)

Tasks should be executed in the order they are listed

Tasks

The following tasks must be performed *(All files should be in the **home folder of the user** in use. For example, if the user is **lsauser**, then the working folder should be **/home/lsauser**)*:

1. Make a local copy of the **/etc/services** file with the same name
2. Using command line tools, create a variant of the local **services** file containing only the **comment lines** (lines starting with **#** symbol) and save it under the name **services_comments.txt**. For example:

```
# Comment line
ssh     22/tcp      # ssh tcp port
ssh     22/udp      # ssh udp port
```

```
# Comment line
```

3. Using command line tools, create another variant of the local **services** file containing everything but the comment lines *(empty lines could be either present or absent in the resulting file)* and save it under the name **services_wo_comments.txt**

```
# Comment line
ssh     22/tcp      # ssh tcp port
ssh     22/udp      # ssh udp port
```

```
ssh     22/tcp      # ssh tcp port
ssh     22/udp      # ssh udp port
```

4. Using command line tools, create third variant of the local **services** file without comment lines and containing only information about **udp** services and save it under the name **services_udp.txt**

```
# Comment line
ssh     22/tcp      # ssh tcp port
ssh     22/udp      # ssh udp port
```

```
ssh     22/udp      # ssh udp port
```

5. Open the file **services_wo_comments.txt** in **vi** editor
6. Find the line about **blackjack** service for ***CentOS*** and ***openSUSE***, or **socks** for ***Ubuntu***
7. Delete **everything** from **this line to the end of the file**
8. Save the result as **new file** under the name **well-known-ports.txt**
9. Quit **vi** without saving the changes to the original file
10. Using command line tools, substitute the symbol **/** with **-** symbol for the **first 100 lines** in the **well-known-ports.txt** file and store the result as **100-well-known-ports.txt**
11. Create *(either using an editor or heredoc)* a document named **doc1.txt** with the following content:
    10-IT-HQ
    20-Accounting-HQ
    30-Help Desk-Remote
    40-Sales-HQ
12. Create *(either using an editor or heredoc)* second document named **doc2.txt** with the following content:
    10-B.Thomas
    20-J.Foster

13. Join the **doc1.txt** and **doc2.txt** files in a resulting file named **doc3.txt** *(it should contain the **combined information** from the other two – in fact it will show **who is working where**)*
14. Enter set of commands to extract the **unique values** from the **third** field of **doc3.txt** file and store them in **locations.txt** file
15. **Extend** the **previous** command in order to **count the unique values** and **store** the result to the **locations-count.txt** file
16. Find **all** files in **/etc** and its **sub-directories** with **size less than 200 bytes** and store their **sorted list** *(containing just the path to the file and its name)* in **small-etc-files.txt** file

Self-Check

After you are done with the tasks, you can check how well you did them

In a terminal session execute one of the following commands (depending on which executable you have)

- Option 1 (**wget** installed, usually for **Debian**-based distributions)
  wget -q https://courses.zahariev.pro/m3.sh -O - | sudo bash
- Option 2 (**curl** installed, most of the distributions)
  curl -s https://courses.zahariev.pro/m3.sh | sudo bash

Repeat the procedure until you get as much **PASS** marks as possible. This may include adjustments on what you did or even start from the beginning
